a

transcriptional activator. LECL. This sequence encodes a HAP3-type CCAAT-box binding protein. LEC1 expression initiates the formation of embryo-like structures and improves growth and recovery of transformants. When apomixis occurs, i.e. the replacement of sexual reproduction of sexual reproduction because the integement, or each specific expression in the megaspore mother cell would trigger embryo formation from maternal tissues only. This results in the production of seeds identical to the parent. Using LEC1, transgenic high yielding seeds could be developed. In addition, LEC1 curansgenic high positive selection of a transformed cell (transgenic plant), for increasing transformation efficiency and for increasing recovery of present sequence is the coding sequence of maize leafy cotyledon 1 New HAP3-type CCAAT-box binding transcriptional activators, particularly Leafy cotyledon 1 transcriptional activator, useful for inducing somatic embryogenesis or apomixis in a plant cell -Claim 1; Page 76-77; 94pp; English. particularly Leafy cotyledon l'transcriptional activator, useful for inducing somatic embryogenesis or apomixis in a plant cell New HAP3-type CCAAT-box binding transcriptional activators, particularly

Claim 1; Page 91-93; 94pp; English.

The present sequence is the coding sequence of wheat leafy cotyledon I transcriptional activator, LEC1. This sequence encodes a RAP3-type CCAAT-box binding protein. LEC1 expression initiates the formation of embryo-like structures and improves growth and recovery of transformants. When apomixis occurs, i.e. the replacement of sexual reproduction by assexual reproduction, LEC1 expression in the nuclellus integument, or eall specific expression in the megaspore mother cell would trigger production of seeds identical to the parent. Using LEC1, transgenic high yielding seeds could be developed. In edition, LEC1 could be used for increasing transformed cell (transgenic plant), for increasing transformation efficiency and for increasing recovery of regenerated plants.

New HAP3-type CCAAT-box binding transcriptional activators, particularly Leafy cotyledon 1 transcriptional activator, useful for inducing somatic embryogenesis or apomixis in a plant cell -

Claim 1; Page 87-89; 94pp; English.

The present sequence is the coding sequence of soybean leafy cotyledon I transcriptional activator, LEC1. This sequence encodes a HAP3-type CCAAT-box binding protein. LEC1 expression initiates the formation of embryo-like structures and improves growth and recovery of transformants. When apomixis occurs, i.e. the replacement of sexual reproduction by assexual reproduction, LEC1 expression in the nuclellus integument, or cell specific expression in the megaspore mother cell would trigger embryo formation from maternal tissues only. This results in the production of seeds identical to the parent. Using LEC1, transgenic high yielding seeds could be developed in addition, LEC1 could be used for increasing transformed cell (transgenic plant), for increasing transformation efficiency and for increasing recovery of

CCAAT-box binding protein. LEC1 expression initiates the formation of embryo-like structures and improves growth and recovery of transformants. When apomixis occurs, i.e. the replacement of sexual reproduction by assexual reproduction. LEC1 expression in the nuclellus integament, or cell specific expression in the megaspore mother cell would trigger embryo formation from maternal tissues only. This results in the production of seeds identical to the parent Using LEC1 transgenic high yielding seeds could be developed. In addition, LEC1 could be used for positive selection of a transformed cell (transgenic plant), for increasing transformation efficiency and for increasing recovery of

The present sequence is the coding sequence of soybean leafy octyledon 1 transcriptional activator, LEC1. This sequence encodes a HAP3-type CCAAT-box binding protein. LEC1 expression initiates the formation of embryo-like structures and improves growth and recovery of transformants. When apomixis occurs, i.e. the replacement of sexual reproduction by sexual reproduction by cell specific expression in the nuclellus integument, or embryo formation from maternal tissues only. This results in the production of seeds identical to the parent. Using LEC1, transgenic high yielding seeds could be developed. In addition, LEC1 could be used for positive selection of a transformed cell (transgenic plant), for increasing transformation efficiency and for increasing recovery of
                                                                                                                                                                                                                         particularly Leafy cotyledon I transcriptional activator, useful for inducing somatic embryogenesis or apomixis in a plant cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ctcggacgacgccaaggagacgatccaggagtgcgtgtcggagtacatcagcttcatcac 310
                                                                                                                                                                                                                                                                                                                                                                                    New isolated plant leafy cotyledon-1 gene - used to develop products for, e.g. increasing storage protein content in plant tissues, or producing fruit with small and non-viable seed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This is the nucleotide sequence of a 3.4 kb fragment of a Arabidopsis leafy cotyledon-1 (LEC1) gene. The 3.4 kb fragment is able to complement learnest. The LEC1 gene is embryo-specific and is sufficient to induce embryonic pathways in transgenic plants. It encodes a 208-amino acid protein (see AAW71722). LEC1 polynucleotide sequences can be used to modulate development (claimed) of embryos or other organs in plants. Inhibiting expression can be useful e.g. in weed control (by transferring an inhibitory sequence to a weedy species and allowing it to be transmitted through sexual crosses) or to produce fruit with small
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  and non-viable seed. Enhanced expression of LEC1 polynucleotide sequences can be used to increase storage protein content in plant tissues to improve nutritional value. Promoter sequences of the LEC1 gene can be used to direct expression of desired heterologous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Length 3395;

The present sequence represents a 3.4 kb Bstyl fragment of Arabidopsis genomic DNA containing sequences from 1.992 kb upstream of the downstream forcyledon 1 (LECI) gene open reading frame to a region 579 bp downstream from the polyA site. The sequence contains the LECI promoter. LECI genes are thought to play a central role in late embryogenesis, in specifying cotyledon identity during embryo development. LECI polypeptides may act as transcription factors. LECI polynucleotides are useful for modulating seed development and for inducing ecotopic development of embryonic tissue in a plant. In both cases, the LECI polynucleotide is introduced into the plant through a sexual cross and is co-expressed in an antisense orientation with a second heterologous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  is co-expressed in an antisense orientation with a second heterologous polynucleotide selected from AP2 and RAP2 genes of Arabidopsis. The LEC1 polynucleotide is also useful for targeting expression in a seed, and for preparing expression cassettes for suppressing or enhancing endogenous LEC1 gene expression, which is useful in weed control or for improving nutritional value of plant tissue respectively. LEC1 polypeptides and polynucleotides are especially used for increasing or decreasing storage protein content in cotyledons or leaves. LEC1 also increases reproductive tissue mass, e.g., increases fruit size, seed

```

```
This is the nucleotide sequence of a 7.4 kb DNA genomic fragment dentified as carrying the Arabidopsis leafy cotyledon 1 (LEC1) gene. It was isolated from a wild-type genomic library. A 3.4 kb ragment (see AAV61023) of the 7.4 kb DNA is able to complement an lect mutant by transformation. The LEC1 gene is embryo-specific and is sufficient to induce embryonic pathways in transgenic plants. It encodes a 108-amino acid protein (see AAW71722). LEC1 polynuclectide sequences can be used to modulate development (claimed) of embryos or other organs in plants. Inhibiting expression can be useful e.g. in weed control (by transferring an inhibitory sequence.to a weedy species and allowing it to be transmitted through sexual crosses) or to produce fruit with small and non-viable seed. Enhanced expression of LEC1 polynucleotide sequences can be used to increase storage protein content in plant tissues to improve nutritional value. Promoter sequences of the LEC1 gene can be used to direct expression of desired heterologous content in an embryo-specific or seed-specific manner.

The present sequence represents a 7.4 kb EcoRI fragment of Arabidopsis genomic DNA containing the Leafy Cotyledon 1 (LEC1) gene promoter.

LEC1 genes are thought to play a central role in late embryogenesis, in specifying cotyledon identity during embryo development. LEC1 polypeptides may act as transcription factors. LEC1 polynucleotides are useful for modulating seed development and for inducing ecocopic development of embryonic tissue in a plant. In both cases, the LEC1 polynucleotide is introduced into the plant through a sexual cross and is co-expressed in an antisense orientation with a second heterologous polynucleotide selected from AP2 and RAP2 genes of Arabidopsis. The LEC1 polynucleotide is also useful for targeting expression in a seed,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        and for preparing expression cassettes for suppressing or enhancing endogenous LEC1 gene expression, which is useful in weed control or for improving nutritional value of plant tissue respectively. LEC1 polypeptides and polynucleotides are especially used for increasing or decreasing storage protein content in cotyledons or leaves. LEC1 also increases reproductive tissue mass, e.g., increases fruit size, seed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    4406 gcacagcaacaacccaaccccaatgaccagctcagtcatagtagccggcggcggtgacaa 4465

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           125 tcatgogtaaaaccttaccgtctcacgccaaaatctctgacgacgacaaagaaacgattc 184
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (LECI) CDNA that engodes a 208-amino acid polypebtide (see AAW71722). The LECI gene clee also AAV61023-24) is embryo-specific and is sufficient to induce embryonic pathways in transgenic plants.

LECI cDNA was isolated from silique-specific cDNA libraries by PCR amplification (see AAV61027-28). LECI polynucleotide sequences can be used to modulate development (claimed) of embryos or other organs in plants. Inhibiting expression can be useful e.g. in weed control (by transferring an inhibitory sequence to a weedy species and allowing it to be transmitted through sexual crosses) or to produce fruit with small and non-viable seed. Enhanced expression of LECI polynucleotide sequences can be used to increase storage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     aaccaccatgtgtggctcgtgagcaagaccaatacatgccaatcgcaaacgtcataagaa 124

The present sequence encodes a Leafy Cotyledon 1 (LEC1) polypeptide.

LEC1 genes are thought to play a central role in late embryogenesis, in specifying octyledon identity during embryo development. LEC1

Dolypeptides may act as transcription factors. LEC1 polynucleotides are polypeptides may act as transcription factors. LEC1 polynucleotides are development of embryonic tissue in a plant. In both cases, the LEC1

development of embryonic tissue in a plant through a sexual cross and is co-expressed in an antisense orientation with a second heterologous polynucleotide selected from AP2 and RAP2 genes of Arabidopsis. The LEC1 polynucleotide is also useful for targeting expression in a seed, and for preparing expression cassettes for suppressing or enhancing endogenous LEC1 gene expression, which is useful in weed control or for improving nutritional value of plant tissue respectively. LEC1 polypeptides and polynucleotides are especially used for increasing or
                                                                                                                                                                                                                                Leafy cotyledon 1 gene; LEC1 gene; embryogenesis; cotyledon identity;

The present sequence is the Veronia mespilifolia coding sequence of leafy cotyledon 1 transcriptional activator, LEC1. This sequence encodes a HAP3-type CCAAT-box binding protein. LEC1 expression initiates the formation of embryo-like structures and improves growth and recovery of
                                                                                                                                                                                                                                                                              transformants. When apomixis occurs, i.e. the replacement of sexual reproduction by asexual reproduction, LEC1 expression in the nuclellus integument, or cell specific expression in the megaspore mother cell would trigger embryo formation from maternal tissues only. This results in the production of seeds identical to the parent. Using LEC1, transgenic high yielding seeds could be developed. In addition, LEC1 could be used for positive selection of a transformed cell (transgenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      351

The present sequence is the coding sequence of maize leafy cotyledon 1 transcriptional activator, LEC1. This sequence encodes a hAB3-type CCAAT-box binding protein. LEC1 expression initiates the formation of embryo-like structures and improves growth and recovery of transformants. When apomixis occurs, i.e. the replacement of saxual reproduction by assaular reproduction, LEC1 expression in the nucleilus integument, or cell specific expression in the megaspore mother cell would trigger embryo formation from maternal tissues only. This results in the production of seeds identical to the parent. Using LEC1, transgenic high yielding seeds could be developed. In addition, LEC1 could be used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New HAP3-type CCAAT-box binding transcriptional activators, particularly Leafy cotyledon 1 transcriptional activator, useful for inducing somatic embryogenesis or apomixis in a plant cell -

```

Eucalyptus grandis or Pinus radiata. The present sequence is the coding sequence for one such transcription factor. The transcription factor may be used to produce a plant having modified gene expression such as a woody plant e.g. a eucalyptus, pine, acacia, poplar, sweetgum, teak, or managany species or to modify the activity of a polypeptide in a plant. The transcription factors of the present invention are members from the following families of regulatory proteins: bZIP, bZIP family of G-box homeotic/homeodomain/homeodomain/homeodomain zipper, LIM domain, AP2 and EREBs, zinc finger domains of type 2 Cys2His2, CCAAT box elements

New isolated polynucleotide encoding a plant transcription factor for producing a plant e.g. a woody plant, preferably eucalyptus or pine, having modified gene expression or modified activity of a polypeptide

WPI; 2000-579369/54.

New isolated polynucleotide encoding a plant transcription factor for producing a plant e.g. a woody plant, preferably eucalyptus or pine, having modified gene expression or modified activity of a polypeptide

## Claim 1; Page 562; 747pp; English.

The present invention relates to movel plant transcription factors from Eucalyptus grandis or Pinus radiata. The present sequence is the coding sequence for one such transcription factor. The transcription factor may be used to produce a plant having modified gene expression such as a woody plant e.g. a eucalyptus, pine, acacia, poplar, sweetgum, teak, or mahogany species or to modify the activity of a polypeptide in a plant. The transcription factors of the present invention are members from the following families of regulatory proteins: bZIP, bZIP family of G-box binding factors, basic helix-loop-helix zipper, LIM domain, AP2

-I. FUNCTION: STIMULATES THE TRANSCRIPTION OF VARIOUS GENES BY RECOMIZING AND BINDING TO A CCAAT MOTTE IN PROMOTERS, FOR EXAMPLE IN TYPE I COLLAGEN, ALBUMIN AND BETA-ACTIN GENES.

-I. SUBUNIT: HETEROMERIC TRANSCRIPTION FACTOR COMPOSED OF TWO COMPONEWRY, A AND B, THAT ARE BOTH NEEDED FOR DNA BINDING.

-I. SUBCELLULAR LOCATION: UNCLEAR.

-I. DOMAIN: CAN BE DIVIDED INTO THREE DOMAINS: THE WEAKLY CONSERVED A DOMAIN: CAN BE DIVIDED INTO THREE DOMAIN THOUGHT TO BE INVOLVED IN SUBUNIT INTERACTION AND DNA BINDING, AND THE GLU-RICH C DOMAIN.

-I. SIMILARITY: BELONGS TO THE CBF-A SUBUNIT FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                               125 REFEGDARGVGLVPGAAPSRGGD-----HHPHSMSPAAMLKSRGPVS-GAAMLPHHHH 176

                                                                                                                                                                                                                                                                              NUCLEIC ACIDS RES. 20:1087-1091(1992).

-I. FUNCTION: STIMULATES THE TRANSCRIPTION OF VARIOUS GENES BY RECOGNIZING AND BINDING TO A CCAAT MOTIF IN PROMOTERS, FOR EXAMPLE IN TYPE 1 COLLAGEN, ALBUMIN AND BETA-ACTIN GENES.

-I. SUBUNIT: HETEROMERIC TRANSCRIPTION FACTOR COMPOSED OF TWO COMPONENTS, A AND B. THAT ARE BOTH NEEDED FOR DNA BINDING.

-I. SUBCELLULAR LOCATION: UNCLEAR.

-I. DOMAIN: CAN BE DIVIDED INTO THREE DOMAINS: THE WEAKLY CONSERVED A DOMAIN; INTERACTION AND DNA BINDING, AND THE GIGHLY CONSERVED IN SUBUNIT INTERACTION AND DNA BINDING, AND THE GIU-RICH C DOMAIN.

-I. SIMILARITY: BELONGS TO THE CBF-A SUBUNIT FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        : |||| :||||| |||| ||| :|| ||| :|||| :||||| :|||| ||| :||| ||| ||| ||| ||| ||| ||| ||| 49 SFREQDIYLPIANVARIMKNAIPQTGKIAKDAKECVQECVSEFISFITSEASERCHQEKR 108

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CYCL EMBO J. 12:4647-4655(1993).

-1- FUNCTION: BINDS TO THE UPSTREAM ACTIVATION SITE (UAS) OF THE CYCL GENE AND OTHER GENES INVOLVED IN MITOCHONDRIAL ELECTRON TRANSPORT AND ACTIVARES THEIR ENERRESSION. RECOGNIZES THE SEQUENCE CCAAT.

-1- SUBUNIT: TWO COMPLEXES BIND CCAAT; COMPLEX I, THAT CONSISTS OF HAP2/3/5 AND COMPLEX II, THAT CONSISTS OF HAP2/3/5 AND COMPLEX II, THAT CONSISTS OF HAP2/3/5 AND COMPLEX II, THAT CONSISTS OF HAP2/3/5/4.

-1- SUBCELLULAR LOCATION: NUCLEAR.

-1- DOMAIN: THE HIGHLY CONSERVED B DOMAIN THOUGHT TO BE INVOLVED IN SUBUNIT INVERACTION AND DNA BINDING, AND THE GLU-RICH C DOMAIN.

-1- SIMILARITY: BELONGS TO THE CBF-A SUBUNIT FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DNA-binding; Transcription regulation; Activator; Nuclear protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic Acids Res. 20:1087-1091(1992).

-I. FUNCTION: STIMULATES THE TRANSCRIPTION OF VARIOUS GENES BY RECOGNIZING AND BINDING TO A CCAAT MOTIF IN PROMOTERS, FOR EXAMPLE IN TYPE I COLLAGEN, ALBUMIN AND BETA-ACTIN GENES.

-I. SUBUNIT: HETEROMERIC TRANSCRIPTION FACTOR COMPOSED OF TWO COMPONENTS, A AND B, THAT ARE BOTH NEEDED FOR DNA BINDING.

-I. SUBCELLULAR LOCATION: UNCLEAR.

-I. DOMAIN. THE HIGHLY CONSERVED B DOMAIN THOUGHT TO BE INVOLVED IN SUBUNIT INTERACTION AND BINDING, AND THE GIU-RICH C DOMAIN.

-I. SIBLIARITY: BELONGS TO THE CBF-A SUBUNIT FAMILY.
                                                                                                                                                                                       01-MAY-1992 (Rel. 22, Created)
01-MAY-1995 (Rel. 22, Last sequence update)
01-NAY-1995 (Rel. 32, Last annotation update)
01-NAY-1995 (Rel. 32, Last annotation update)
CCAAT-BINDING TRANSCRIPTION FACTOR SUBUNIT A (CBE-A) (NF-Y PROTEIN
CHAIN B) (NF-YB) (CAAT-BOX DNA BINDING PROTEIN SUBUNIT B) (RFAGMENT).
Xenopus laevis (African clawed frog).

Address for correspondence: kaosékazusa.or jp For the latest information on annotation of this clone, please see http://www.kazusa.or.jp/kaos/cgi.bin/agd_graph.cgi?c=MuJ7 Genes with similarity to proteins in the databases are described in 'product' or 'note' qualifiers. Genes that have no significant protein similarity are described as 'unknown protein' protein similarity are described as 'unknown protein' The software programs used to predict genes include: Grail (Informatics Group, Oak Ridge National Laboratory, http://comppio.ornl.gov/grail.1.3/), GENSCAN (Chris Burge, MIT, http://ccm.011.3/), GENSCAN (Chris Burge, MIT, http://ccm.011.3/), GENSCAN (Chris Burge, MIT, http://ccm.011.3/), GENSCAN (Chris Burge, MIT, http://ccm.011.20ol.iastate.edu/cgi.bin/sp.cgi).

Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, Washington University School of Medicine, St. Louis, http://genome.wustl.edu/eddy/tRNAscan-SE (Sean Eddy, Washington University School of Medicine, St. Louis, This sequence may not be the entire insert of this clone. It may be shorter because we remove overlaps between neighboring submissions. NOTE: It currently consists of 1 contigs. Gaps between the contigs are represented as runs of N. The order of the pleces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submitter. This sequence will be replaced by the finished sequence as soon as it is available and the accession number will be preserved.

NOTE: It currently consists of 1 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submitter. This sequence will be replaced by the finished sequence as soon as it is available and the accession number will be preserved.

On Dec 17, 1999 this sequence version replaced q1:3738275.
The sequence and annotation of chromosome after removing of the individual clones on this chromosome after removing overlaps. For detailed information, please see the TIGR web site (http://www.tigr.org/tdb/atc.html).

Genes were identified by a combination of three methods: Gene prediction programs including GRAIL (ftp://arthur.epm.orh.lgov/pub/xgrail), Genefinder (Phil Green, University of Mashington), Genscan (Chris Burge, Arthur.epm.orh.lgov/pub/xgrail), searches of the (http://www.cbs.dtu.dk/services/NetGene2/), searches of the complete sequence against a peptide database and plant EST databases at TIGR, and manual curations based on those analyses. Annotated genes with similarity to cother proteins are named to indicate the level of evidence for their annotation. Genes with similarity are named as 'unknown' proteins. Genes without significant peptide similarity but with EST similarity are named as 'unknown' protein or EST similarity, that are predicted by two or more gene prediction programs over most of their length are annotated as 'hypothetical' proteins. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, TRNAscan-SE). Simple repeats were indentified by repeatmasker (Arian Smit, http://ftp.genome.wustl.edu/eddy/RNARpeatMasker.html). Genes are numbered from the top to bottom of the chromosome.

We thank the CSHL/WashU/ABI consortium for sequencing BAC clones F6P23, F5J6, T17A5, and T13L16, the ESSA group for sequencing clone F13D4, and Scott Jackson, Jiming Jiang, Klaus Meyer, Eric Richards and Satoshi Tabata for helpful assistance. In addition, we would like to thank the TIGR Bioinformatics Department, especially Lixin Zhou, Hanif Khalak, Michael B. Heaney, Lily Fu, Feng Liang, Jeremy Peterson, Michael Holmes, and Delwood Richardson for software and database support.

On Dec 17, 1999 this sequence version replaced gi:4558656.
The sequence and annotation of chromosome 2 were merged from those of the individual clones on this chromosome after removing overlaps. For detailed information, please see the TIGR web site (http://www.tigr.org/tdb/at/at.html).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Submitted (09-MAR-2000) The Institute for Genomic Research, 9712
